7.1.2. Possible Combinations from Three Digits

Peusdocode:

1. START
2. READ a single line of input from the user, split it by spaces, and STORE the three string values into variables a, b, and c.
3. PRINT the concatenation of a, b, and c (representing the combination). 4. PRINT the concatenation of a, c, and b (representing the combination). 5. PRINT the concatenation of b, a, and c (representing the combination).

6. PRINT the concatenation of b, c, and a (representing the combination). 7. PRINT the concatenation of c, a, and b (representing the combination).

8. PRINT the concatenation of c, b, and a (representing the combination).
9. END

abc

acb

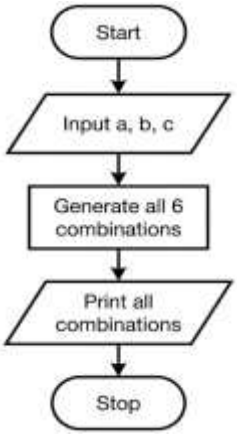
bac

bca

cab

cba

Flowchart:



Code:

```
digits = input().split()
for i in range(3):
    for j in range(3):
        for k in range(3):
            if i != j and j != k and i != k:
                print(digits[i] + digits[j] + digits[k])
```
